DETAILED ACTION

Allowable Subject Matter

Claims 1-9 are allowed.

Regarding independent claim 1, the closest prior art to the instant invention is Takahashi (USP 5,044,839). TAKAHASHI teaches an insert having an upper surface with an apical angle part and having a polygonal shape in top view and forming an edge and a chip breaker (7), said chip breaker has a substantially symmetrical shape with respect to a section bisecting the apical angle of said apical angle part, and has a protrusion (6) and a flat part (3a: with shear angle of 0 degrees) provided between said protrusion and said apical angle part ('839, figures 1 and 11). TAKAHASHI also teaches a pair of arcuate ridges (R1 & R2: see figure below) on the apex of said protrusion (6) directed towards the nose of the insert. Please refer to attachment I submitted with the previous Office Action dated 2/14/08, page 10, for the detailed explanation of how TAKAHASHI reads on the angle (X) formed by the tangential line of the arcuate ridge at a point bisecting the arcuate ridge of the protrusion and a bisector of the apical angle. Please note: although TAKAHASHI does not disclose ridge length, distance and height difference of the forward end of said apical angle part and first intersection (P), whereby line segment ratio is between 0.2 and 0.8, it would have been obvious to one having ordinary skill in the art at the time the invention was made to vary ridge length (depending on the size of the insert), distance from the corner and the height of the chip breaker depending on the application of the tool and the thickness of the insert (as

Art Unit: 3724

evidenced by De Beaupre et al., US Pub. No. 2003/0063955, paragraph 22, which states “The actual height of the chip breaker will depend on the overall size of the cutting insert and the intended application”), because it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art.

However, TAKAHASHI fails to anticipate or make obvious the insert being prepared by bonding a superhard sintered body (with a surface roughness of 0.1-0.5 μ m) containing cubic boron nitride to at least the upper surface of an apical angle part of the insert body. TAKAHASHI also fails to teach a chamfer/land being formed on the intersection between the upper surface and the side surface and said pair of ridges reaching said chamfer.
